## **ABSTRACT**

The aim of the present study was to examine and analyze the role of ergogenic aid in Olympic weightlifting. The paper focuses to finding out how different kinds of ergogenic aid affect the Olympic weightlifting performance. For the classification and analysis of ergogenic aid the Nutritional, Physiological, Psychological, Pharmacological and Biomechanical aids have been selected for the study. The Olympic Weightlifting sport has two fundamental skill Snatch and Clean and Jerk. This skill requires Nutritional, Physiological, Psychological, Pharmacological and Biomechanical support for optimum performance during the training and Competition. The skills of Olympic Weightlifting require instant energy for the lift of maximum weight with the use of absolute and dynamic strength motion. Nutritional, Psychological and Pharmacological support improve the performance and increase chances for winning the competitions. A review of the literature reveals that Ergogenic aid affects the Olympic weightlifting performance. Therefore, the use of Ergogenic aid Nutritional, Physiological, Psychological, Pharmacological and Biomechanical improve competition and training performance seem to be justified.

**Keywords:-**Nutritional, Physiological, Psychological, Pharmacological and Biomechanical, Olympic Weightlifting, Ergogenic Aid.

## INTRODUCTION:

Achievement in the sports continues to improve for the variety of reasons. The Technological improvements in equipment design provide mechanical, biomechanical and new coaching methods improve the Physiological fitness, Nutrition, Psychological and skill state. (Melvin, H, 1989). The overall development to top level in the Olympic Weightlifting sport in recent years have seen the change in the approach of the training system, Nutritional, Psychological,

Physiological and technical support to achieve excellence in weightlifting skills Snatch and Clean & jerk. There are three types of variables for optimal performance in weightlifting that would somewhat Control. Physiological, Psychological and Nutritional preparation and help the weightlifters pre, during and post the performance. All three Variables are interrelated to each other. Nutritional variable ability works as source of energy, Physiological variable ability works to supply of energy (ADP-ATP) and Psychology variable ability works to control the energy.

Ergogenic word is derived from the Greek words Ergon (work) and Gennan (to Produce). It is understood as work producing or work enhancing. The means of Ergoenic aids in sports help to improve athletic performance beyond that which may occur through natural ability and training (Melvin, H 1989). The athletes useergogenic aids to improve and enhance performance through energy utilization, including energy production, control and efficiency. In the Aerobic and Anaerobic nature of sports the athletes use ergogenic aid as the best legal supplements to maximize strength, endurance and lean body mass.(Reimers, E,2020)

In the sports competition and training, athletes have been using different types of special aids in attempt to improve performance. In the ancient time much of the concentration was on nutritional aspects as specific organs of animals. They believed that consuming the lion heart in the diet affects athlete's willpower during the competitions. Over the 50 years athletes of both Aerobic and Anaerobic nature of sports are trying to experiment the improved performance through enhance used drugs such as opium, alcohol, Bicarbonate soda, Ammonia inhalants, Caffeine and more for developed athletic abilities before, during and after the competitions. In the field of Sports and Exercise Sciences athletes and sport scientists work on variety of ways to classify ergogenic aid to Olympic weightlifting sports performance, but for the purpose of this paper five ergogenic aid were used: Nutritional, Physiological, Psychological, Pharmacological and Biomechanical for the study.

The **graphic 1** shows the classification of Ergogenic Aids.

## **Nutritional Aids**

There are six types of nutrients which is used in the daily diet to the athletes Carbohydrates, Proteins, Vitamins, Fats, Minerals and Water. These nutrients supply energy when and where required, Pre and post training or competitions. Nutritional aids as supplements consist of Amino Acid; Creatine is widely used as supplements in powder form in the Power and strength sports. These aids are aimed primarily at enhancing performance by affecting energy metabolism or by effects on the central nervous systems. This aids also increase lean body mass or muscle mass by stimulation of protein synthesis and reducing body fat content. (Maughan, R.J,1999).

Olympic weightlifting sport is in which the competitive performance is so short that all of the energy for the lift performance requires high energy phosphates, ATP and P Cr metabolism process. Weight Lifters

Research & Academic Publishing www.ijobsms.org

need energy for dominating use of path way of ADP-ATP and PCr as a source of energy for the reaching at optimum level of Performance or assist efforts for very short periods of time in three attempts of lifts. In weightlifting sport the multi-vitamins and mineral supplements is popular among the coaches and athletes, other Ergogenic Aid in the form of powders such as a amino acid, caffeine and creation monohydrate are also used by weightlifters or strength training athletes. (Brill &Kence,1994). The Nutritional values of food sources of Protein, Amino Acids, Creatine is the only supplement that has been reported to enhance skeletal muscle hypertrophy and functional capacity in the response to resistance training in the pre and post workout. (Hespel&Dewrave 2007). It was evident that Nutritional Aids as a supplement plays important role in training and performance. The Olympic weightlifting skills require greater focus on training load, specific body weight, Timing and quantity of food supplement as a Nutritional Aids.

## **Physiological Aids**

Physiological aids are substances designed specifically to improve physiological processes that enhance human energy production. (Melvin, H, 1989). In the Olympic weightlifting athletes require legal supplementations (No drugs) Creatine, Alkaline Salt (Sodium bicarbonate) and Ammonia Salt. Studies with strong evidence suggest Sodium bicarbonate supplementation is very popular in the high intensity nature of Sports. Sodium bicarbonate has effective performance enhancers in the pre training or competition. Theinhaling or smelling salts of ammonia help athlete's lifts more weight by causing a reaction in the membranes of nose and lungs and the breath works faster and their heart rate increase, so this reaction releases Adrenaline and help athletes to ignore the load pursuers or pain. (Lucas, K.2021) Creatine is good option for heavy repetitions and recovers faster between the sets during the weightlifting and Power lifting sports. Several studies evaluated that Physiological Aids response, the Creatine, Alkaline Salt and ammonia show the similar result in weightlifting.

## **Psychological Aids**

In the Olympic weightlifting sport the body and mind depend on each other for optimal functioning, mind affect the body and body affect the mind. Athlete body energy systems and

support system activated in pre and post weightlifting training, is controlled by the brain and spinal cord contractions, known the Central Nervous System. The central Nervous system controls the energy system and to produce good movement functions and fulfill the required demands of the training and Competition. The Central Nervous System work Physiological activity in the body, on the other hand brain or mind also control thoughts, emotional feelings, Perceptions, Anxiety experienced at the Pre, during and Post weightlifting training and Competitions situations. The Various Psychological Aids as Mental training improve the athletic performance such as Attention Control, Autogenic training, Concentration, Implosive Goal setting, Imagery, Deep Breathing, Meditation and Relaxation Imagery trainings. (Williams, M, 1989).

## Pharmacological Aids

Pharmacological aid includes the agents or drugs which is used by athletes, illegal and legal, for improving the sports Performance. From the legal point of view the Creatine Monohydrate Supplementation has shown significant gain in the strength, Power, Mass and water retention in the weightlifting athletes. The Caffeine substance does not show improvement in the reaction time, strength, power in the high intensity sports. Studies with strong evidence suggest that Creatine Monohydrate have been improving the Physical and Psychological functional Capacity and recovery of Pre and Post training session. Research has shown that in Weightlifting athletes appear to be the most prolific users of Ashwagandha, an herbal supplement used to improve the strength, power and recovery of the muscles as physical demand during the pre and post training.

## **Biomechanical Aids**

Biomechanical aid helps to understand the scientific principle of Mechanical and Biomechanics area and to study for better performance at pre, during and post training level. In the weightlifting skills the primary goal is to move Barbell with weight through explosive movement with accuracyand fulfilling the required demand of the training and Competition. The various Characteristics, types and design of equipments like barbell, Platform, Plats and Collar matter in

Research & Academic Publishing www.ijobsms.org

performance and athletes require well designed equipments to get optimum performance using less energy. In the Olympic weightlifting athletes, Coaches used the Biomechanical aids such as Sports Equipments, Body Position, Body Composition, way of trajectory of Barbell, Movement of barbell and laws of Physics were studied with the Use of Computers, Motion analyses camera for improving the techniques and predicting performance. The research in weightlifting sports biomechanics is constantly looking to improve athlete performance by modifying the ways that athletes apply in the pre, during and post training and competitions.

#### **CONCLUSION:**

The aim of this study was to highlight the Ergogenic Aids in relation with OlympicWeightlifting Sport. In the view of related literature and number of researcher stated that the legal Ergogenic Aids such as Nutritional, Physiological, Psychological, Pharmacological and Biomechanical found strong relation to Olympic Weightlifting Sport performance during the training and Competitions.
